

## Solving Exponential and Logarithm Equations

- If possible, write both sides of the equation with same base,  $b$ .
  - Example: What is the solution of  $256^{2x} = 64$ ?
- If not easily possible to write both sides of the equation with the same base, use logarithm properties to gain access to the exponent variable. Take  $\log$  or  $\ln$  of both sides.
  - Example: What is the solution of  $6^{4x} = 512$ ?
  - Example: What is the solution of  $5^{2x} = 3500$ ? *Use calculator method.*
- Example: What is the solution of  $\log(5x + 2) = 2$ ?
- Example: What is the solution of  $\log 2x^2 - \log 5 = 1$ ?
- You invest \$500 at an annual interest rate of 5.25%, compounded continuously. How long will it take your money to double?
